Intro to Research Data Management for PoliSci

Michelle Hudson
Fall 2014

http://bit.ly/intro-rdm-polisci

Overview:

Using the DDI data lifecycle model as a guide, this workshop will cover the following questions:

1. What does this stage of the data lifecycle involve?
2. What resources are available for doing it well at Yale (& elsewhere)?
3. What are guidelines for managing data at this stage?

michelle.hudson@yale.edu

What is research data?

Research data is defined as "the recorded factual material commonly accepted in the scientific community as necessary to validate research findings." [1]

1. Observational: captured in real time, usually irreplaceable (sensor readings, telescope images, sample data, surveys).
2. Experimental: data from lab equipment, can be reproducible but may be expensive (gene sequences).
3. Simulation: data generated from test models (climate models).
4. Derived or compiled: reproducible but expensive (data mining, compiled databases).

[1] OMB Circular A-110.

Research data comes in many formats of information: documents, spreadsheets, field notebooks, survey responses, audio and video recordings, images, film, specimens, software code, and can be structured and stored in a variety of file formats.

Study concept

DMPTool https://dmptool.org   Log into the DMPTool with your Yale NetID and password and get access to great tools for building a data management plan for the agency of your choice.

Data Management Consultation Group http://csssi.yale.edu/dmp   The consultation group can review plans, help write plans, or help refer to needed services.

Data consultants http://csssi.yale.edu/csssi-statistical-consultants-schedule CSSSI's data consultants can help you figure out how to collect, analyze, or use your data, formulate research methodology, or just help you think through concepts.

Data collection & documentation

Yale-supported resources:

• Box - 50G of cloud-based storage space

• EliApps - Yale's version of Google Drive, etc.

• Qualtrics - Sophisticated survey building software.

• GitHub - Code/data/file repositories with version control.

Data processing & analysis

• Stata, SAS, MatLab, R, OpenRefine, Python
• DataONE software tools catalog
• Tech at CSSSI http://csssi.yale.edu/tech

Data archiving, preservation, distribution, and citation:

Doing long-term preservation of your data yourself includes migrating files to different formats or media, ensuring the integrity of the digital files, and making sure that the digital media the files are stored on are secure. This is a lot of work. It's worthwhile to look into domain-appropriate preservation and distribution channels.

• DataCite https://www.datacite.org/
• re3data http://www.re3data.org
• DataBib http://databib.org/

Guidelines:

1. Visit the CSSSI before you start your project.
2. Consider making a data management plan for your project even if you aren't seeking a grant.

Data collection & documentation:

1. Look at great examples of documentation, like the General Social Survey.
2. Consistency: whatever you do, stick with it.
3. Level of detail: What would someone need to know to re-use your data or replicate your findings?

Data processing & analysis:

1. Visit the CSSSI before you start your project.
2. Keep track of everything you do and always keep versions of your data sets.
3. Best practices for working with data during analysis – folder structures, naming conventions, statistical package considerations.
4. Back up data in accordance with good practice.

Data archiving & preservation:

1. Backup is not sufficient for preservation.
2. Handing over your data to a repository like ICPSR is possible, and will ensure the data is usable over the long-term.

Data distribution & citation:

1. Give your data set a title and make it easy to credit you.
2. Always cite data that you use as if it were as important as the journal articles you cite.
